ABSTRACT (Continue on reverse side if necessary and identify by block number)<br>The One-Dimensional Laser and Mixing Program (ODLAMP) is de-<br>scribed for analyzing multi-species lasing in a chemically reacting one-<br>dimensional stream with mass addition. Mass is assumed to be injected<br>(at a prescribed rate) from each of two separate streams, into a primary<br>lasing stream. Lasing due to P-transitions (i. e., transitions proceeding<br>from $(v+1, J-1)$ to $(v, J)$ ) is treated. Both the analysis and computer pro-<br>grams are presented, including an input guide, sample calculation and<br>flow chart. |                       |   |

## FOREWORD

This document is Volume III of a five-part final report which presents the results of work performed by the Lockheed Huntsville Research & Engineering Center under Contract DAAH01-74-C-0173 for the Propulsion Directorate, U. S. Army Missile Research, Development and Engineering Laboratory, U. S. Army Missile Command, Redstone Arsenal, Alabama. This work was monitored by Mr. William D. Martin of the Propulsion Directorate.

The period covered by this report was from 20 September 1973 to 30 June 1974.

The final report for this contract is comprised of the following volumes:

1. Laser and Mixing Program Theory and User's Guide (LMSC-HREC TR D390222-I)
2. Chemical Laser Flow Analysis (LMSC-HREC TR D390222-II)
3. One-Dimensional Laser and Mixing Program Guide (LMSC-HREC TR D390222-III)
4. Method of Characteristics Laser and Mixing Program Theory and User's Guide (LMSC-HREC TR D390222-IV)
5. Rotational Relaxation Effects (LMSC-HREC TR D390222-V).

This report documents the work done to modify and update the capabilities of OD-LAMP and supersedes report Technical Report RK-CR-73-2. A summary of the modifications incorporated in this report may be found in the Introduction.

## Section 1

### INTRODUCTION

The importance of continuous wave (cw) chemically pumped lasers has generated a number of investigations designed to enhance the understanding of laser devices and their potential. These investigations have led to the development of sophisticated chemical laser models (Refs. 1 through 3) which couple the fluid mechanic, nonequilibrium chemistry and laser radiation processes. Unfortunately, however, these computer models require a large amount of computer time to analyze one set of conditions. Consequently, when performing design studies where many variables must be investigated the computer time requirements are considerable.

In this report a one-dimensional chemical laser model is presented which approximates the two-dimensional effects of mixing. Since it is one-dimensional and requires solution along only one streamline as opposed to the 10 to 20 streamlines required in two-dimensional mixing analyses, computer run times are reduced significantly.

As Fig. 1 shows, mass from two dissimilar secondary streams is injected into a primary lasing stream at some prescribed rate which varies with longitudinal distance. Excitation of the active medium traversing a Fabry-Perot optical cavity is achieved by the highly exothermic nonequilibrium reactions occurring in the cavity region.

The program can handle three simultaneously lasing species each of which in turn can have an arbitrary number of vibrational levels. Lasing at either fixed-J or shifting-J rotational lines can be treated. The transition gains (from  $v+1, J-1 \rightarrow v, J$ ) are computed accounting for the effects of both Lorentz and Doppler broadening. In addition, the program can handle mirror absorptivities and reflectivities which vary with longitudinal position.

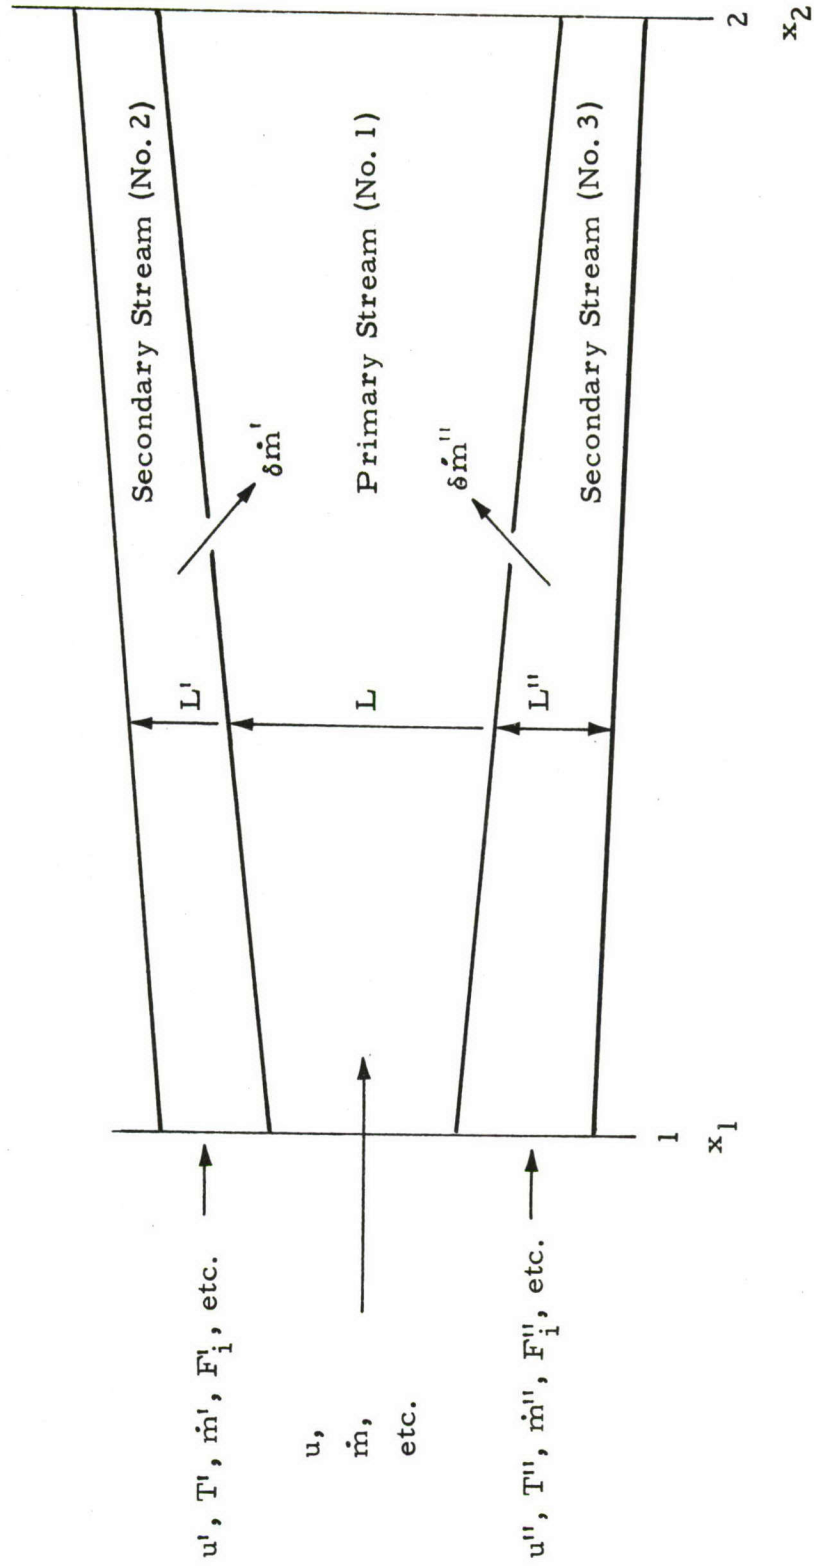

Fig. 1 - Flow Schematic

The program allows any chemical reaction mechanism to be investigated as long as the rate coefficients and species thermodynamic data are known. Thermodynamic data taken directly from the JANNAF thermochemical tables is input in tabular form.

In this report the governing equations and a complete description of the computer program are given including an input guide, and a sample calculation. The output of the computer program gives the longitudinal distribution of pressure, velocity, temperature, species mole fractions, laser transition gains, radiative intensities, and laser power output.

Modifications made and incorporated in this report are as follows:

- Page 2-2 — Equations 2a, 2b and 2c have been updated to include the wall force term in the momentum equation. This term was inadvertently not included in the original document.
- A new Section 7 — Program Usage and Comparison has been added. This section briefly discusses the program operational experience to date and shows a comparison between the ODLAMP and LAMP predictions for the same sample case.
- Page B-5 — The input has been modified to only require input of the collision broadening constants (Card 20) when Lorentz and Doppler broadening are to be used (LFLAG = 1, Card 1).
- Appendix C — Additional sample input and output have been provided for the multi-specie lasing case (DF and CO<sub>2</sub>).

## Section 2

### ANALYSIS

It is assumed that the injection rates for each of the two secondary streams into the primary lasing stream are known as a function of longitudinal position. The computer program then solves for the fluid mechanic and chemical properties. The flow properties (pressure, velocity, temperature, species concentrations and cross sectional area) are defined using the conservation of momentum, energy and mass relationships along with the continuity equation and equation of state. Closure is obtained with the condition that one flow parameter (either pressure, temperature or cross-sectional area) is known.

Referring to Fig. 1 the governing equations for the three streams are:

#### Mass

##### Stream (1) - Primary\*

$$(\rho u)_1 \left( \frac{\partial F_j}{\partial x} \right)_1 = \dot{w}_{i_2} + R_{i_1} \quad (1a)$$

##### Stream (2) - Secondary

$$F_i^I = \text{constant} \quad (1b)$$

##### Stream (3) - Secondary

$$F_i^{II} = \text{constant} \quad (1c)$$

---

\*In Eq. (1a) note that  $\dot{w}$  is evaluated at the forward integration point (station 2). This is because an implicit scheme is used to analyze the chemistry effect.

## Momentum

### Stream (1)

$$\dot{m}_2 u_2 = \dot{m}_1 u_1 + \delta m' u_1' + \delta m'' u_1'' - C_1 (p_2 L_2 - p_1 L_1) + C_1 p_m (L_2 - L_1) \quad (2a)$$

$$\text{where} \quad p_m \equiv \frac{p_1 + p_2}{2}$$

### Stream (2)

$$\dot{m}_2' u_2' = \dot{m}_1' u_1' - \delta m' u_1' - C_1 (p_2' L_2' - p_1' L_1') + C_1 p_m' (L_2' - L_1') \quad (2b)$$

### Stream (3)

$$\dot{m}_2'' u_2'' = \dot{m}_1'' u_1'' - \delta m'' u_1'' - C_1 (p_2'' L_2'' - p_1'' L_1'') + C_1 p_m'' (L_2'' - L_1'') \quad (2c)$$

## Energy

### Stream (1)

$$\begin{aligned} \dot{m}_1 \left( \frac{h_1}{\bar{W}_1} + C_2 \frac{u_1^2}{2} \right) + \delta m' \left( \frac{h_1'}{\bar{W}_1'} + C_2 \frac{u_1'^2}{2} \right) \\ + \delta m'' \left( \frac{h_1''}{\bar{W}_1''} + C_2 \frac{u_1''^2}{2} \right) = \dot{m}_2 \left( \frac{h_2}{\bar{W}_2} + C_2 \frac{u_2^2}{2} \right) + Q_1 (x_2 - x_1) L \end{aligned} \quad (3a)$$

### Stream (2)

$$\left( \frac{h_1'}{\bar{W}_1'} + C_2 \frac{u_1'^2}{2} \right) = \left( \frac{h_2'}{\bar{W}_2'} + C_2 \frac{u_2'^2}{2} \right) \quad (3b)$$

### Stream (3)

$$\left( \frac{h_1''}{\bar{W}_1''} + C_2 \frac{u_1''^2}{2} \right) = \left( \frac{h_2''}{\bar{W}_2''} + C_2 \frac{u_2''^2}{2} \right) \quad (3c)$$

### Continuity

#### Stream (1)

$$\dot{m}_2 = \dot{m}_1 + \delta m' + \delta m'' \quad (4a)$$

#### Stream (2)

$$\dot{m}_2' = \dot{m}_1' - \delta m' \quad (4b)$$

#### Stream (3)

$$\dot{m}_2'' = \dot{m}_1'' - \delta m'' \quad (4c)$$

where  $\dot{m} = \rho u L$

### State

$$P = \frac{\rho R T}{W} \quad (5)$$

### Threshold Condition

$$\bar{\alpha}(x) = - \frac{\ln(r_o r_L)}{2\mathcal{L}} \quad (6)$$

### Gain (Along Streamline)

$$\alpha_{i=L} = \epsilon_L \rho (S_{U,L} F_U - S_{L,U} F_L) \quad (7)$$

where  $S_{U,L}$  and  $S_{L,U}$  are given by Eqs. (2.29) and (2.30) in Ref. 1 for the case of Doppler and Lorentz broadening. In the expressions given above the non-superscripted parameters refer to properties in the primary stream. The constants  $C_1$  and  $C_2$  have been included in order to make the equations dimensionally consistent based upon the units given in the Nomenclature. The parameters  $R$  and  $Q$  account for lasing influences upon the mass and energy relations, respectively, and are equal to zero when  $\alpha_i < \bar{\alpha}$ . The subscripts  $U$  and  $L$  refer to the upper and lower laser levels, respectively.

The species mass fractions computed from Eq. (1a) do not take into account the mass injected between station  $x_1$  and  $x_2$ , consequently they must be modified. This is done as follows: The mass fractions,  $Y_i$ , are first computed at station  $x_2$  from Eq. (1a). Then they are modified to account for the mass injected between  $x_1$  and  $x_2$  from

$$Y_{i_2} = \frac{\dot{m}_i}{\dot{m}_1 + \sum_{j=1}^2 (\delta m \Delta x)} Y'_{i_2} \quad (8)$$

where  $Y'_{i_2}$  is the mass fraction computed using Eq. (1a).

The parameters  $R$  and  $Q$  are functions of the gain,  $\alpha$ , and internal intensity,  $I$ , and are given by

$$R_{i=L} = \frac{\alpha_L I_L}{\epsilon_L} - \frac{\alpha_{L-1} I_{L-1}}{\epsilon_{L-1}} \quad (9)$$

and

$$Q = \sum_{j=1}^{LS} \sum_{k=1}^{VL} \alpha_{j,k} \beta_{j,k} I_{j,k} \quad (10)$$

where

$$\beta_{j,k} = \frac{h_{j,k} + \epsilon_{j,k} - h_{j,k+1}}{\epsilon_{j,k}} \quad (10a)$$

The double subscript denotes the  $j^{\text{th}}$  lasing species and its  $k^{\text{th}}$  vibrational level where  $LS$  is the number of lasing species and  $VL$  the number of vibrational levels for each lasing species. The internal intensities are obtained by solving a set of simultaneous equations of the form

$$I_{L-1} G_{L-1} - I_L G_L + I_{L+1} G_{L+1}$$

$$- \sum_{k=1}^{VL} I_k G_{LK} = \frac{d\alpha_L}{dx} - G_o \quad (11)$$

where the  $G_s$  are given by Eqs. (35) through (39) in Ref. 1. A separate set of simultaneous equations must be solved for each lasing species.

The cavity power (for each lasing line) is then obtained from

$$P_{out_{i=L}}(x) = \int_{x_{th_i}}^x I_{out_i} z \, dx \quad (12a)$$

where (case 1)

$$z = 1 \quad (12b)$$

when the optical path lies in the plane containing the three streams,  
and (case 2)

$$z = \frac{L + L' + L''}{(L + L' + L'')_{x=0}} \quad (12c)$$

when the optical path is perpendicular to the plane containing the three streams.  
In Eq. (12a)

$$I_{out_{i=L}} = \alpha_i I_i \mathcal{L} \quad (13)$$

The total output power (per initial width of three streams for case 1 and per unit height of nozzle bank for case 2) is then

$$P_{out} = \sum_{j=1}^{LS} \sum_{i=1}^{VL} P_{out_{i,j}} \quad (14)$$

### Section 3

#### CHEMICAL REACTION RATE EQUATIONS

#### 3.1 REACTION RATES

The production rates for all chemical species are calculated in the usual fashion. The same treatment is applied to the various vibrational levels of reacting molecules, and of the lasing molecules in particular, that is, vibrational levels are treated as individual chemical species.

Twelve types of reaction or vibrational energy transfer mechanisms are considered as possible contributors to the calculation of the net rate of production,  $\dot{w}_i$ :

##### Reaction type

|         |           |                      |           |     |
|---------|-----------|----------------------|-----------|-----|
| (1, 7)  | A + B     | $\rightleftharpoons$ | C + D     | [1] |
| (2, 8)  | A + B + M | $\rightleftharpoons$ | C + M     | [2] |
| (3, 9)  | A + B     | $\rightleftharpoons$ | C + D + E | [3] |
| (4, 10) | A + B     | $\rightleftharpoons$ | C         | [4] |
| (5, 11) | A + M     | $\rightleftharpoons$ | C + D + M | [5] |
| (6, 12) | A + M     | $\rightleftharpoons$ | C + M     | [6] |

Reaction types (7) through (12) correspond to reaction types (1) through (6), but proceed in the forward direction only.

The net rate of production for all reactions is given below in the form  $\dot{w}^{(j)} = RP^{(j)} - RM^{(j)}$  which are the symbols used in the computer program.

$$1. \quad \dot{w}^{(j)} = k_f \rho^2 F_A F_B - \frac{k_f \rho^2 F_C F_D}{K_p} \quad (15a)$$

$$2. \quad \dot{w}^{(j)} = k_f \rho^3 F_A F_B F_M - \frac{k_f \rho^2 F_C F_M}{K_p \mathcal{RT}} \quad (15b)$$

$$3. \quad \dot{w}^{(j)} = k_f \rho^2 F_A F_B - \frac{k_f \rho^3 F_C F_D F_E \mathcal{RT}}{K_p} \quad (15c)$$

$$4. \quad \dot{w}^{(j)} = k_f \rho^2 F_A F_B - \frac{k_f \rho F_C}{K_p \mathcal{RT}} \quad (15d)$$

$$5. \quad \dot{w}^{(j)} = k_f \rho^2 F_A F_M - \frac{k_f \rho^3 F_C F_D F_M \mathcal{RT}}{K_p} \quad (15e)$$

$$6. \quad \dot{w}^{(j)} = k_f \rho^2 F_A F_M - \frac{k_f \rho^2 F_C F_M}{K_p} \quad (15f)$$

To reduce round-off and truncation errors,  $RP^{(j)}$  and  $RM^{(j)}$  for each reaction are computed separately. All contributions to the molar rate of production of a given species are then computed and added algebraically to form  $\dot{w}_i$ . Since reaction types (7) through (12) proceed in the forward direction only, the second term on the right-hand sides of Eqs. (15a) through (15f) is disregarded in calculating the contributions to  $\dot{w}_i$ .

In reactions (2), (5) and (6) as well as in (8), (11) and (12), M denotes the catalytic species which can be specified. In case of reactions (2, 8), (5, 11) and (6, 12) the situation often occurs where for various catalytic species the respective rate constants differ only by a constant multiplier. These multipliers can be considered as third body efficiencies or weighting factors. If such a case is encountered, the third body species mole mass ratio  $F_M$  becomes effectively a fictitious mole mass ratio, consisting of the weighted sum over all those species having a nonzero weighting factor, i.e.,

$$F_M = \sum_i f_i F_{M_i} \quad (16)$$

where  $f_i$  are the weighting factors.

### 3.2 RATE CONSTANTS

The forward rate constant  $k_f$  is generally expressed in Arrhenius form. The equilibrium constant,  $K_p$ , is determined from the Gibbs free energy difference

$$\ln K_p = - \Delta G / \mathfrak{R} T \quad (17)$$

For speed in computation the rate constants are divided into five types:

#### Rate Coefficient Type

$$(1) \quad k_f = A \quad (18a)$$

$$(2) \quad k_f = A T^{-N} \quad (18b)$$

$$(3) \quad k_f = A \exp (B / \mathfrak{R} T) \quad (18c)$$

$$(4) \quad k_f = A T^{-N} \exp (B / \mathfrak{R} T) \quad (18d)$$

$$(5) \quad k_f = A T^{-N} \exp (B / \mathfrak{R} T^M) \quad (18e)$$

## Section 4

### THERMODYNAMIC PROPERTIES

To make maximum usage of the current technology of finite rate formulations, the vibrational levels of respective excited molecules are treated as individual chemical species. This, of course, requires separate specification of the thermodynamic properties for molecules in each vibrational level. This is accomplished by the assumption that the molecular rotation is in equilibrium at the translational temperature but allows the molecules to vibrate independently of the translational temperature. Accordingly, each molecule is permitted to vibrate independently corresponding to the energy in its respective vibrational level.

Thermodynamic data is input directly in tabular form. The thermodynamic properties (specific heat, entropy and enthalpy) for each species are taken directly from the JANNAF thermochemical tables (Ref. 4) (or other such source) and input to the program as described in Appendix B. Properties are obtained from the tables by linear interpolations on temperature. The Gibbs' free energy is computed from the JANNAF enthalpy, entropy and temperature.

## Section 5

### PROGRAM OPTIONS

The computer code has been developed around three primary options. They are

1. The longitudinal distribution of temperature in each of the three streams is known a priori.
2. The longitudinal distribution of pressure in each of the three streams is known a priori.
3. The longitudinal distribution of the total cross-sectional area of the three streams is known a priori.

#### Temperature Option

For the case where the temperature distribution is assumed to be known the calculational procedure is as follows:

1. Species mass fractions are computed using Eqs. (1) and (8).
2. The velocities in the primary and secondary streams are then obtained using Eqs. (3).
3. With the velocities now known the pressures in the three streams can be computed using Eqs. (2).
4. The densities are then found from the equations of state (Eq. (5)).
5. The areas of the three streams are computed from continuity (Eqs. (4)).

#### Pressure Option

For the case when the pressure distribution is assumed to be known the calculational procedure is as shown on the following page.

1. Same as Temperature Option
2. The velocities are computed using Eqs. (2)
3. Temperatures are then computed using the energy equations (Eqs. (3)).
4. Same as Temperature Option
5. Same as Temperature Option.

#### Area Option

When the area is assumed to be known the solution becomes iterative. The solution follows that for the pressure option case. A pressure at point  $x_2$  is assumed and the area computed and checked against the known area. If the computed and known areas do not agree the assumed pressure at point  $x_2$  is modified. This procedure continues until agreement is reached.

For this option the pressure variations for all three streams are assumed to be identical, but unknown. If the pressure variations are not taken to be identical a unique solution cannot be found.

## Section 6

### PROGRAM FEATURES

#### ● Dynamic Dimensioning

In order to establish core storage requirements which are sufficient to run a particular case but yet keep from setting aside core storage which is unused, dynamic dimensioning has been incorporated into the ODLAMP code. Prior to compilation of the ODLAMP code, therefore, the variable subscripts used in the common and dimension statements must first be replaced by their appropriate integer values for the particular case being considered. This is done by running the ODLAMP Dynamic Dimensioning Program. This program reads as input the ODLAMP code and the variable subscript names and their integer values. The ODLAMP code is then searched and all variable subscripts are replaced by their respective integer values, thereby generating a new ODLAMP program tape. This tape is then rewound, compiled and executed. The input guide for the ODLAMP Dynamic Dimensioning Program is given in Appendix A.

#### ● Plotting (Page or 4020 plots)

If so desired the user may have plotted selected parameters (e.g., laser power, pressure, species mole fractions, etc.) as a function of distance. This is done by setting IPLOT = 0, 1, 2 or 3. If IPLOT = 0, plots are omitted. If IPLOT = 1 page plots are obtained which gives, after each 50 output stations as well as at laser cutoff, a plot of each of the parameters as a function of distance. If IPLOT = 3 the desired data will be stored on logical unit 4 for subsequent plotting on the 4020. If IPLOT = 2, both page and 4020 plots are obtained. The number and identification of the parameters to be plotted are read in on cards 22 and 23.

#### ● Optical Cavity Width

The user may select as the width of the optical cavity either the width of the three streams which is evaluated locally or a width which is input.

The selection of which option desired is made on card 2. If the width is input it is given by an equation of the form

$$\mathcal{L} = Q_0 + Q_1x + Q_2x^2$$

where  $\mathcal{L}$  and  $x$  are in centimeters. The coefficients are read in on card 24.

#### ● Mirror Properties

In order to make the program flexible, mirror absorptivities and reflectivities are treated as variable functions of distance. They are given by equations of the form

$$r \text{ (or } a) = Q_0 + Q_1x + \beta_2x^2 + Q_3x^3 + Q_4x^{-1} + Q_5x^{-2} + Q_6 \exp(-x/Q_7)$$

The coefficients are read in on cards 8-11.

#### ● Doppler/Lorentz Broadening

An option which allows the user to select either Doppler/Lorentz broadening or Doppler (only) broadening is provided (See card 2). However, it is recommended that the Doppler/Lorentz option be exercised until such time as the user becomes familiar with the conditions where the Doppler (only) broadening approximation is adequate.

#### ● Chemical Kinetic Rates

An output option is provided (card 2) which, if exercised, prints out at all output stations the species kinetic rates, the forward and reverse reaction rates for all chemical reactions and the forward and reverse rate coefficients for all chemical reactions.

● Mixing Rate

The rate at which mass from each of the two secondary streams is injected into the primary lasing stream is assumed to be known a priori as a function of longitudinal position. The mass injection rates are then described by an equation of the form

$$\delta\dot{m} = Q_0 + Q_1x + Q_2x^2 + Q_3x^3 + Q_4x^{-1} + Q_5x^{-2} + Q_6 \exp(-x/Q_7)$$

where  $\delta\dot{m}$  and  $x$  are in  $\text{gm-cm}^{-1}\text{-sec}^{-1}$  and  $\text{cm}$ . The coefficients are read in on cards 6 and 7.

## Section 7

### PROGRAM USAGE AND COMPARISON

#### 7.1 PROGRAM USAGE

This section briefly describes some of the operational characteristics of the ODLAMP program which have been observed during development and check-out. Relatively little operational experience has been obtained to date other than exercising the various options for selected test cases. Therefore, the comments that follow will probably not cover specific characteristics which will be uncovered as the program is more extensively used.

The various types of cases considered thus far may be summarized as follows:

- Single stream, finite rate chemistry analyses in variable area ducts without laser radiation.
- Simulation of multi-stream viscous mixing of dissimilar streams with finite rate chemistry and no laser radiation.
- Premixed single stream analyses of one lasing specie (HF or CO<sub>2</sub>) with both fixed and shifting J levels (Appendix C-1).
- Premixed single stream analyses of two simultaneously lasing species (DF and CO<sub>2</sub>) with shifting J levels (Appendix C-2).
- Multi-stream simulation of viscous mixing of dissimilar streams with finite rate chemistry and one lasing species (HF).

Program execution times are naturally a function of linear step size. Logically, larger input step sizes would mean less execution time. However, one must remember that the laser radiation package contained in the program traces discontinuities such as threshold, J shift and cutoff. The program iteratively solves for the axial location of these discontinuities with a high degree of accuracy. The actual step size may be drastically less than that

which is input. Therefore, specific run time characteristics are difficult to ascertain.

Generally, the run times for a radiation calculation are equivalent to those of the LAMP code for a premixed stream where explicit chemistry is used. However, run times for non-radiating cases are drastically reduced due to the utilization of the implicit finite rate chemistry model.

Another observed characteristic is the ability of the program to handle the transition from supersonic to subsonic flow conditions. This provides additional utility where duct flows are of interest.

Generally, the program is relatively free of external "fine tuning adjustments" associated with many numerical techniques and requires few pre-execution calculations to establish input data.

## 7.2 ODLAMP COMPARISON WITH LAMP (REF. 1)

The ODLAMP (one-dimensional laser and mixing program) is the manifestation of a one-dimensional theoretical simplification of the two-dimensional LAMP (Ref. 1) code. The ODLAMP simulates the two-dimensional viscous mixing by injecting mass at prescribed rates into a primary (lasing) medium. Excitation of the active medium traversing a Fabry-Perot optical cavity is achieved by the highly exothermic nonequilibrium reactions occurring in the cavity region.

A sample case was selected and the data input to both the LAMP and ODLAMP codes. The sample case was selected such that direct comparisons of the flow, chemistry and radiation parameters could be obtained. A hydrogen fluoride (HF) with helium (He) diluent medium was selected. Six vibrational levels of HF were considered in the model. The following table contains the input initial conditions.

$$\begin{aligned}
 U_i &= 5.58 \times 10^3 \text{ m/sec} \\
 P_i &= 20 \text{ torr} \\
 T_i &= 500^\circ\text{K}
 \end{aligned}$$

| Chemical Species          | Mole Fraction |
|---------------------------|---------------|
| HF(0) $\rightarrow$ HF(6) | 0.0           |
| F                         | 0.1           |
| F <sub>2</sub>            | 0.01          |
| H                         | 0.0           |
| H <sub>2</sub>            | 0.39          |
| He                        | 0.5           |

Both analyses assumed constant pressure as a function of axial distance and both operated at the rotational level producing maximum gain via J shifting. Fifty reactions and five catalytic species were used.

Figures 7-1, 7-2, and 7-3 show the results of both analyses. Comparisons are shown of the axial distributions of temperature (Fig. 7-1), species mole fractions (Fig. 7-2), and radiation intensity (Fig. 7-3) for both the ODLAMP and LAMP. This check case demonstrates the ability of ODLAMP to duplicate the LAMP one-dimensional premixed calculations.

Figure 7-4 illustrates one of the unique features of ODLAMP, i.e. that of simultaneous lasing from two different molecules. In this case 4 transitions of DF and the  $10.6\mu$  line of the CO<sub>2</sub> molecule were all handled simultaneously.

The advantages of dynamic dimensioning used in ODLAMP were demonstrated by the fact that ODLAMP required computer core storage of only 57,000 octal words compared to 134,000 octal words for the LAMP code. This becomes a definite advantage where computer systems use core storage requirements in assigning job priorities.

Appendix A  
ODLAMP DYNAMIC DIMENSIONING PROGRAM  
(Input Guide)

## Appendix A

This appendix contains an input guide for the ODLAMP Dynamic Dimensioning Program. This program establishes the necessary storage requirements for the ODLAMP code.

There are seven (7) required input variables. No specific order of input is required. The data are input in the format of one variable name and its corresponding integer value per data card.

| Card | Format | Column | Variable |   |
|------|--------|--------|----------|---|
| 1    | I10    | 10     | NOP      | Number of input variables<br>(7 for ODLAMP)                     |
| 2-8  | A10    | 1-10   | OPT(1)   | Variable name (left adjusted)                                   |
|      | I10    | 11-20  | OPT(2)   | Integer value assigned to the<br>variable name (right adjusted) |

The following is a list of the required input variables for the ODLAMP program.

- 1 - NS = Number of chemical species + 1
- 2 - NM = Number of catalytic species
- 3 - NMS = NS + NM
- 4 - NT = Number of temperature values in thermodynamic tables
- 5 - NR = Number of chemical reactions
- 6 - NX = Total number of lasing transitions for all lasing species
  - = NVS(1) for 1 lasing species
  - = NVS(1) + NVS(2) + 1 for 2 lasing species
  - = NVS(1) + NVS(2) + NVS(3) + 2 for 3 lasing species
- 7 - NY = NX + 1.

Appendix B  
ONE-DIMENSIONAL LASER AND MIXING PROGRAM  
(ODLAMP)  
(Input Guide)

## Appendix B

This appendix contains an input guide for the One-Dimensional Laser and Mixing Program (ODLAMP) developed by the Lockheed-Huntsville Research & Engineering Center. This guide, along with the information from the rest of this report, provides the necessary information for the user of this program.

| Card | Format | Column | Variable | Description   |
|------|--------|--------|----------|---|

|      |        | 60     | NSTRM    | Number of streams (3 max.)  |
|      |        | 65     | IGAS     | = 0 - Gas dynamics and chemistry only<br>= 1 - Includes radiation   |
|      |        | 70     | KFLAG    | = 1 - Condensed laser output<br>= 2 - Detailed output for each transition   |
|      |        | 75     | IPLOT    | = 0 - Omit plots. Do not read cards 22 and 23.<br>= 1 - Page plots only<br>= 2 - Page and 4020 plots<br>= 3 - 4020 plots only |
|      |        | 80     | ILASL    | = 0 - Width of lasing zone based on overall width of streams<br>= 1 - Width of lasing zone read in as input. Read card 24.    |

NOTE: Cards 3, 4 and 5 contain the independent variable coefficients. The independent variable type is defined by ITYPE (Card 1). The physical units input are:

| <u>ITYPE</u> | <u>Independent Variable</u> | <u>Units</u> |
|--------------|-----------------------------|--------------|
| 1            | Temperature                 | K            |
| 2            | Pressure                    | torr         |
| 3            | Area                        | cm           |

The known axial distributions of the variables on Cards 3 through 11 are input through equations of the form:

$$Q = Q_0 + Q_1x + Q_2x^2 + Q_3x^2 + Q_4x^{-1} + Q_5x^{-2} + Q_6 \exp(-x/Q_7)$$

| Card   | Format | Column     | Variable | Description  |

The following cards contain the thermodynamic data\*\*. The first card contains the species name, molecular weight and heat of formation. The second and remaining cards contain the temperature and corresponding specific heat, entropy and enthalpy for that species. Two temperatures and corresponding thermodynamic data are placed on each card. The input table can contain up to a maximum of 30 temperature points. The data are input exactly as presented in the JANNAF tables.

\* Stream 1 is the reacting/lasing stream.

\*\* The order of the species must be identical to the order on card type 21a. Lasing species data must be given first, in the order  $v=0$ ,  $v=1$ ,  $v=2$ , etc., followed by  $v=0$ ,  $v=1$ , etc., for the second lasing species (if necessary) and similarly for the third lasing species.

| Card | Format | Column | Variable | Description                                |
